

Storybook: Making Sense of the Pieces

Figure 1: Storybook should simplify everything.

Storybook simplifies. It lets people know how to work with shared assets. RosettaDash ships with five Storybook catalogs, one for each framework. The ports are 6006 (Web Components), 6007 (React), 6008 (Vue), 6009 (Angular), 6010 (Svelte). The header says RosettaDash · {runtime} catalog.

Example:

```
npm run storybook:react
```

Open <http://localhost:6007>. You land on **Getting Started** → **Start here**.

The sidebar

Getting Started has three pages: the map of the catalog, a component count, and styling modes.

Figure 2: One sidebar — Getting Started, Components, Meta. Same map on every runtime.

Catalog / Components is one story per builder group, plus an all-components scroll, plus the `npm rd-*` layout atoms. The previews use the same visual language as the builder's preview panel.

Figure 3: One Components page — a data display, isolated.

Catalog / Meta components are made up of multiple components. These ten recipes provide a preview of the Dashboard Atlas, which is created using all of the components.

Figure 4: One Meta recipe — diagram, preview, XML.

Styling, briefly

Getting Started includes **Styling modes**: minimal, tokens, themed. That is how a consumer decides whether they are taking `--rd-*` tokens, the `.rd-*` classes, or fitting the pieces next to Tailwind, CSS Modules, or MUI. The stack styling guides in the repo go further.

Next

Destination Atlas ties the pieces together in a functioning working application for each target frameworks.
